The invention relates to a hydraulic shock absorber with an axially slidable piston member in a cylindrical chamber. At its peripheral surface the piston member carries a surrounding slotted elastic ring element. In order to increase the speed of response of the absorber the invention suggests that mating conical surfaces on the piston and ring, respectively, have mutually different conicity with core angles and diameters such selected that in an outward return movement of the piston member the same is urged with its steeper conical peripheral surface against the less conical inner surface of the surrounding ring element and brings a first abutment into engagement with the yieldable ring element while - at the same time - radially expanding the same so as to leave only a small intentional, clearance for letting through hydraulic fluid between the outer surface of the ring element and the inner surface of the cylinder.

Continuation of: V.

The cited documents represent the general state of the art, and the invention defined in claims 1-4 is not disclosed by any of these documents. The cited prior art does not give any indication that would lead a person skilled in the art to the claimed shock absorber. Hence, the invention defined in claims 1-4 is novel, non-obvious and is considered to involve an inventive step. The industrial applicability is evident.
